Game Title

Lava Escape

Player Objective

The player must complete the obstacle course by jumping across platforms, avoiding falling into the lava, using buttons to get past obstacles, and reaching the end of the level.

Core Mechanic

The main mechanic is jumping across platforms and avoiding hazards. The player also interacts with scripted objects, such as buttons that make doors transparent and platforms that change color or transparency.

Win / Completion Condition

The player wins by completing all of the obstacles and safely reaching the finish area.

Major Environment Features

The game includes a large lava-filled area, different colored platforms, narrow paths, walls around the course, interactive obstacles, a button-controlled door, changing platforms, and a finish area.

Required Scripts

The game needs scripts for the lava hazard and respawn system, the button and transparent door, and the changing platforms.

Must-Have Features

Lava hazard, jumping platforms, working spawn and respawn, button and door interaction, changing platforms, written instructions, and a clear finish area.

Optional Features

Collectible coins or stars, sound effects, a timer, score counter, moving platforms, extra obstacles, checkpoints, and a “You Win!” message.

Who tested the project:

We both tested the game by playing through the obstacle course multiple times and also other classmates tested our game.

Important observation or feedback:

Feedback we received was that the main goal of avoiding the lava was clear. However the buttons and transparent door interaction could be confusing without instructions players might not know what to do.

What we changed:

We added collectible coins, sound effects for checkpoints and disappearing platforms, and arrows at the beginning of the obstacle course to show players where to start.

Why we made the revision:

We made this change so the game would be easier to understand and the player would know what to do without needing someone to explain it.

One scripted feature in our game is the button that makes the door become transparent.. That is triggered when the player steps on the button. The script then changes the door so it can become transparent allowing the player to walk through it. As a result you can see that the button worked and you're able to continue moving forward through the obstacle course.

AI Tool Used; ChatGPT

We used ChatGPT to help us troubleshoot some of the scripting in our game. One example was the timed disappearing platforms. We were having trouble getting the platforms to change correctly and then return to normal after a few seconds. ChatGPT suggested changes to the script and explained how the timing should work. We tested the suggestions in Roblox Studio by stepping on the platforms several times and checking that they disappeared or changed, then reset correctly. We made a few adjustments until the mechanic worked the way we wanted.
